1 ACNE

What is Acne?

- Acne is an inflammatory disease of the pilosebaceous unit (hair follicle + sebaceous gland),

It's primarily triggered by:

- Excess sebum production
- Keratinocyte hyperproliferation
- Bacterial colonization by Propionibacterium acnes
- Inflammation

Progression by Stage

Stage 1: Micro-comedone Formation (Early Mild Acne)

- Keratinocytes inside the follicle do not shed properly, they accumulate and stick together.
- Sebaceous glands become more active (often triggered by hormones)
- This creates Micro-comedone.

Treatment Goal:

- Comedolytics.
- Sebum Regulators.

1 ACNE

Stage 2: Visible Comedones (Still Mild Acne)

- Whiteheads: the pore remains closed, forming a flesh-colored or white bump.
- Blackheads: the pore opens and oxidation of sebum leads to a dark appearance (not dirt).

Treatment Focus:

- Comedolytics.
- Sebum Regulators.

Stage 3: Inflammatory Lesions Begin (Moderate Acne)

- Propionibacterium acne, which normally lives on the skin, overgrows inside clogged pores.
- It digests trapped sebum and releases pro-inflammatory mediators.

This leads to:

- **Papules**: red, raised bumps without pus.
- **Pustules**: red bumps filled with white/yellow pus (dead neutrophils).

Treatment Strategy:

- Antibacterial agents.
- Soothing agents.
- Sebum regulators.

1 ACNE

Stage 4: Severe Nodulocystic Acne

- The infection and inflammation penetrate deep into the dermis.

This causes:

- Nodules: large, painful lumps under the skin.
- Cysts: pus-filled lumps that resemble boils and may rupture under the skin.

Chronic inflammation at this stage can lead to:

- Post-inflammatory hyperpigmentation (especially in darker skin types).
- Scarring and tissue damage.

Treatment Protocol:

- Referral to dermatologists is essential.
- Topical treatments are no longer sufficient.

Comedolytics /Keratolytic

- **AHA (Glycolic – lactic - Mandelic – citric)**
- **BHA (Salicylic – LHA) / Retinoids**

REXSOL acne treatment cream
Q+A glycolic acid daily toner
differin gel

Sebum Regulator

- **Zinc / Koalin**

BIODERMA sebium global
JAYJUN purifying control mask wash-off
SKINCODE pore refining mask

Antibacterial

- **Benzoyl peroxide.**

PANOXYL acne foaming wash 10% benzyol peroxide

Soothers

- **Licorice (Glycerhetinic Acid) / Thermal Water / Aloe vera / Allantoin / Niacinamide.**

AVENE thermal spring water

2 Hyperpigmentation

Refers to dark patches or uneven skin tone caused by excess melanin accumulation.

Pathophysiology - Step-by-step process:

1- Stimulation of Melanocytes Triggered by:
- UV radiation (especially UVA and UVB)
- Inflammation (acne, eczema, injury)
- Hormonal changes (e.g., estrogen, progesterone, MSH)
- Medications or photosensitizing agents.

2- Activation of Tyrosinase
- Within melanocytes, the enzyme tyrosinase is activated. It catalyzes Melanin formation (eumelanin / pheomelanin)

3- Melanosome Formation
- Melanin is synthesized in melanosomes—organelles specific to melanocytes.

4- Transfer to Keratinocytes
- Melanosomes are transferred into surrounding keratinocytes through cytoplasmic extensions.

- **Tyrosinase Inhibitors**
  - **Licorice, Arbutin, Hydroquinone, Kojic acid, azelaic acid, Vitamin C/E/A**
  - **BEAUTY OF JOSEON** glow deep serum : rice +alpha-arbutin
- **Melanosome Transfer Inhibitor**
  - **Niacinamide, Soybean extract**
  - **THE ORDINARY** niacinamide solution 30 ml
- **Pheomelanin Pathway**
  - **Glutathione**
- **Exfoliators**
  - **Exfoliators (Glycolic acid, Lactic acid, Salicylic acid, ….. Etc)**
  - **THE ORDINARY** lactic acid 5% + ha

3 Wrinkles

- Skin aging is a complex process influenced by both internal and external factors.
- It leads to visible signs like wrinkles, sagging, dryness, and uneven tone due to cellular and structural changes in the skin.

Note: Fibroblasts are the primary cells responsible for producing collagen, elastin, and hyaluronic acid in the skin.

Causes of Skin Aging

External (Extrinsic) Factors “Accelerators":

- Sun Exposure (UV Rays), Smoking, Pollution, Lack of Sleep, Poor Nutrition

Internal (Intrinsic) Factors "Natural Clock":

- Genetics, Hormonal Changes

Ageing Pathophysiology

Oxidative Stress and Free Radicals:

- Chronic Inflammation (Inflammaging):
- Impaired Skin Barrier and Hydration:
- Reduced Microcirculation and Nutrient Delivery:
- All these lead to wrinkles formation.

Fibroblast stimulators

- **Retinol, Peptides**

INSTITUT ESTHEDERM intensive retinol cream
SKINCODE cellular wrinkles serum
LA ROCHE POSAY retinol b3 anti-aging serum

Antioxidant

- **Ascorbic acid**

GARNIER fast bright vitamin c serum 15 ml

Blood circulation Promoter

- **Gold, Caffeine, Dextran sulphate, Ginseng.**

L'OREAL anti-aging cream ginseng
THE ORDINARY caffeine solution
